

## PROJECT SPECIFICATION

**Generate TV Scripts****Required Files and Tests**

CRITERIA	MEETS SPECIFICATIONS
Have all project files been included with the submission?	The project submission contains the project notebook, called "dInd_tv_script_generation.ipynb".
Have all the unit tests in the project passed?	All the unit tests in project have passed.

**Preprocessing**

CRITERIA	MEETS SPECIFICATIONS

CRITERIA	MEETS SPECIFICATIONS
Does the <code>create_lookup_tables</code> function correctly create lookup dictionaries?	<p>The function <code>create_lookup_tables</code> create two dictionaries:</p> <ul style="list-style-type: none"><li>• Dictionary to go from the words to an id, we'll call <code>vocab_to_int</code></li><li>• Dictionary to go from the id to word, we'll call <code>int_to_vocab</code></li></ul> <p>The function <code>create_lookup_tables</code> return these dictionaries in the a tuple (<code>vocab_to_int</code>, <code>int_to_vocab</code>)</p>
Does the project correctly create a token dictionary?	The function <code>token_lookup</code> returns a dict that can correctly tokenizes the provided symbols.

## Build the Neural Network

CRITERIA	MEETS SPECIFICATIONS

CRITERIA	MEETS SPECIFICATIONS
Does the project create the correct input tensors?	<p>Implemented the <code>get_inputs</code> function to create TF Placeholders for the Neural Network with the following placeholders:</p> <ul style="list-style-type: none"> <li>• Input text placeholder named "input" using the TF Placeholder name parameter.</li> <li>• Targets placeholder</li> <li>• Learning Rate placeholder</li> </ul> <p>The <code>get_inputs</code> function return the placeholders in the following the tuple (Input, Targets, LearningRate)</p>
Does the project correctly create a RNN Cell and initialize it?	<p>The <code>get_init_cell</code> function does the following:</p> <ul style="list-style-type: none"> <li>• Stacks one or more BasicLSTMCells in a MultiRNNCell using the RNN size <code>rnn_size</code>.</li> <li>• Initializes Cell State using the MultiRNNCell's <code>zero_state</code> function</li> <li>• The name "initial_state" is applied to the initial state.</li> <li>• The <code>get_init_cell</code> function return the cell and initial state in the following tuple (Cell, InitialState)</li> </ul>
Does the project correctly apply word embeddings?	<p>The function <code>get_embed</code> applies embedding to <code>input_data</code> and returns embedded sequence.</p>

CRITERIA	MEETS SPECIFICATIONS
Does the project correctly build a RNN using the RNN Cell?	<p>The function <code>build_rnn</code> does the following:</p> <ul style="list-style-type: none"> <li>• Builds the RNN using the <code>tf.nn.dynamic_rnn</code>.</li> <li>• Applies the name "final_state" to the final state.</li> <li>• Returns the outputs and final_state state in the following tuple (Outputs, FinalState)</li> </ul>
Does the project correctly build the neural network?	<p>The <code>build_nn</code> function does the following in order:</p> <ul style="list-style-type: none"> <li>• Apply embedding to <code>input_data</code> using <code>get_embed</code> function.</li> <li>• Build RNN using cell using <code>build_rnn</code> function.</li> <li>• Apply a fully connected layer with a linear activation and <code>vocab_size</code> as the number of outputs.</li> <li>• Return the logits and final state in the following tuple (Logits, FinalState)</li> </ul>
Does the project correctly batch the data?	<p>The <code>get_batches</code> function create batches of input and targets using <code>int_text</code>. The batches should be a Numpy array of tuples. Each tuple is (batch of input, batch of target).</p> <ul style="list-style-type: none"> <li>• The first element in the tuple is a single batch of input with the shape [batch size, sequence length]</li> <li>• The second element in the tuple is a single batch of targets with the shape [batch size, sequence length]</li> </ul>

## Neural Network Training

CRITERIA	MEETS SPECIFICATIONS
Does the project use reasonable hyperparameters?	<ul style="list-style-type: none"> <li>• Enough epochs to get near a minimum in the training loss, no real upper limit on this. Just need to make sure the training loss is low and not improving much with more training.</li> <li>• Batch size is large enough to train efficiently, but small enough to fit the data in memory. No real "best" value here, depends on GPU memory usually.</li> <li>• Size of the RNN cells (number of units in the hidden layers) is large enough to fit the data well. Again, no real "best" value.</li> <li>• The sequence length (seq_length) here should be about the size of the length of sentences you want to generate. Should match the structure of the data. The learning rate shouldn't be too large because the training algorithm won't converge. But needs to be large enough that training doesn't take forever. Set show_every_n_batches to the number of batches the neural network should print progress.</li> </ul>
Does the project achieve a good loss?	The project gets a loss less than 1.0

### Generate TV Script

CRITERIA	MEETS SPECIFICATIONS
Does the project load the correct tensors?	"input:0", "initial_state:0", "final_state:0", and "probs:0" are all returned by <code>get_tensor_by_name</code> , in that order, and in a tuple

CRITERIA	MEETS SPECIFICATIONS
Does the project predict reasonable words?	The <code>pick_word</code> function predicts the next word correctly.
Does the project generate a TV script?	<p>The generated script looks similar to the TV script in the dataset.</p> <p>It doesn't have to be grammatically correct or make sense.</p>
